The landscape of the Polish Carpathians

GIOVEDÌ 26 NOVEMBRE ORE 14.00

Aula 11C DST

Via dei Mulini - BENEVENTO

Abstract

The landscape of the Polish Carpathians is the result of a complex geological structure and relief-forming processes that mold their surface. A wealth of landforms, bedrock exposures, and mineral and thermal waters, combined with the unique highland culture, makes the region a major draw for tourists. Although the geological heritage of the Carpathians often remains merely a backdrop for hiking and recreation, it constitutes a legible archive of Earth's history and a valuable educational resource. This presentation will discuss selected geosites in the Polish Carpathians as examples of geotourism attractions, pointing to ways of integrating geological heritage into contemporary tourism and environmental education.
